

Functional & Performance Testing Template

Model Performance Test

Date	October 03,2026
Team ID	SWTID-2026-7210
Project Name	Script Controlled ACL: Restrict Record Access Based On Field Value
Maximum Marks	4 Marks

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass / Fail
FT-01	Text Input Script Validation	Enter valid syntax conditions and random malformed inputs into the ACL custom rule editor backend.	Valid syntax configurations accepted seamlessly; proper parser errors shown for invalid code layers.	System parsed conditions efficiently and returned accurate debug warning codes for malformed structures.	Pass
FT-02	Field Value Restriction Enforcements	Query data streams where targeted metadata field parameters match restricted status values (e.g., Status == 'Confidential').	Intercepts backend query responses and dynamically strips out unauthorized table record items from the stream.	Data rows matching specific evaluation rules were safely hidden away from non-admin API endpoint fetches.	Pass
FT-03	GenAI Policy Generation Engine	Provide detailed plain natural language instructions and click 'Generate Policy Layout Template' inside console dashboard.	Correct functional JSON structural access parameters and security rules configurations are synthesized safely.	Integrated AI language model translated the user text into pristine structured code rule sets successfully.	Pass
FT-04	Secure API Interceptor Gateway Sync	Verify connection authorization flows when user tokens attempt access against live dynamic context gates.	The target API responds successfully and checks structural parameters before mapping active payload elements.	Database connection handshakes and interceptor tokens synchronized cleanly with zero pipeline breaks.	Pass
PT-01	Dynamic System Response Latency	Deploy a microsecond timer logging matrix evaluation times under active concurrent field rules parsing blocks.	Dynamic policy processing and rows filtering layers must operate perfectly under a maximum of 3 seconds threshold.	Average rule matching and secure evaluation executed exceptionally fast in under 142ms runtime bounds.	Pass

PT-02	API Interceptor Gate Load Test	Bombard backend API interceptors with multiple parallel asynchronous data fetch evaluation requests simultaneously.	Gateway structures do not suffer speed drops, routing failures, memory crashes or data transaction blockages.	The application clustered infrastructure handled active heavy stress loops seamlessly without scaling fatigue.	Pass
-------	-----------------------------------	---	---	--	------

PT-03	Policy Profile Matrix Loading Data	Upload massive multi-region nested corporate configuration datasets files into the sandboxed code runtime compiler.	Processes the complex multi-tier validation parameters smoothly without encountering engine memory heap crash loops.	Isolated sandbox runtimes managed high-volume criteria checks perfectly, preserving operational balance.	Pass
